Averages	97.2%	98.2%

Charts were examined for patients, aged 5-40, with a diagnosis of persistent asthma to verify that the patient had an acceptable pharmacological treatment plan.

All sites and Providers scored above the 50% goal.

Those charts which did not meet the measure had asthma listed as the diagnosis for the visit in conjunction with other diagnoses, but nothing was addressed concerning asthma.

Most records were documented with "Patient Education for Asthma" in addition to addressing the pharmacological treatment. For PCMH purposes it is best to include the patient education in the record even though this quality measure does not require it.
